

Estimation of PV electricity generation for the chosen location

Modify the parameters of your PV installation and click the "Submit" button. [[help](#)]

PV technology: Crystalline silicon

Enter installed peak PV power 57 kWp

Estimated system losses (%) [0.0:100.0] 14.0

Module inclination [0,90] 35 deg.

Module orientation [-180;180] (E:-90 S:0) 0 deg.

Use given inclination and orientation
 Find optimal inclination for given orientation
 Find optimal inclination and orientation

Show performance for 2-axis tracking system
 Show horizon outline graph
 Show also the in-plane irradiation

Click to confirm your choice

Location: 39°52'51" North, 4°15'41" East, Elevation: 55 m a.s.l,

Nearest city: Mao, Spain (1412820 km away)

Nominal power of the PV system: 57.0 kW (crystalline silicon)

Inclination of modules: 35.0°

Orientation (azimuth) of modules: 0.0°

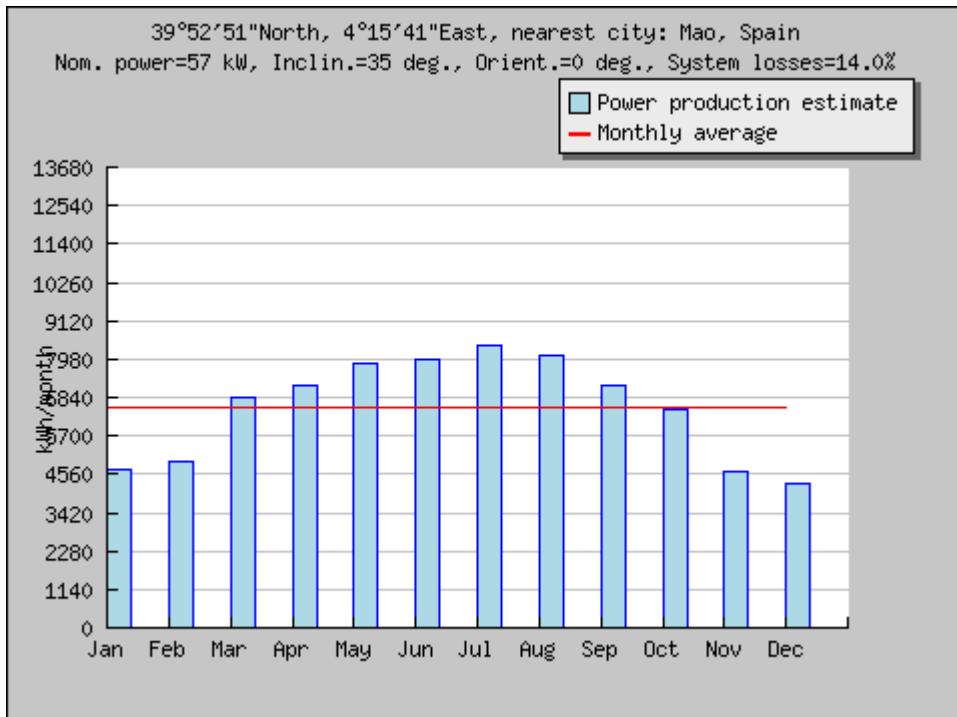

Estimated losses due to temperature: 8.9% (using local ambient temperature data)

Estimated loss due to angular reflectance effects: 2.6%

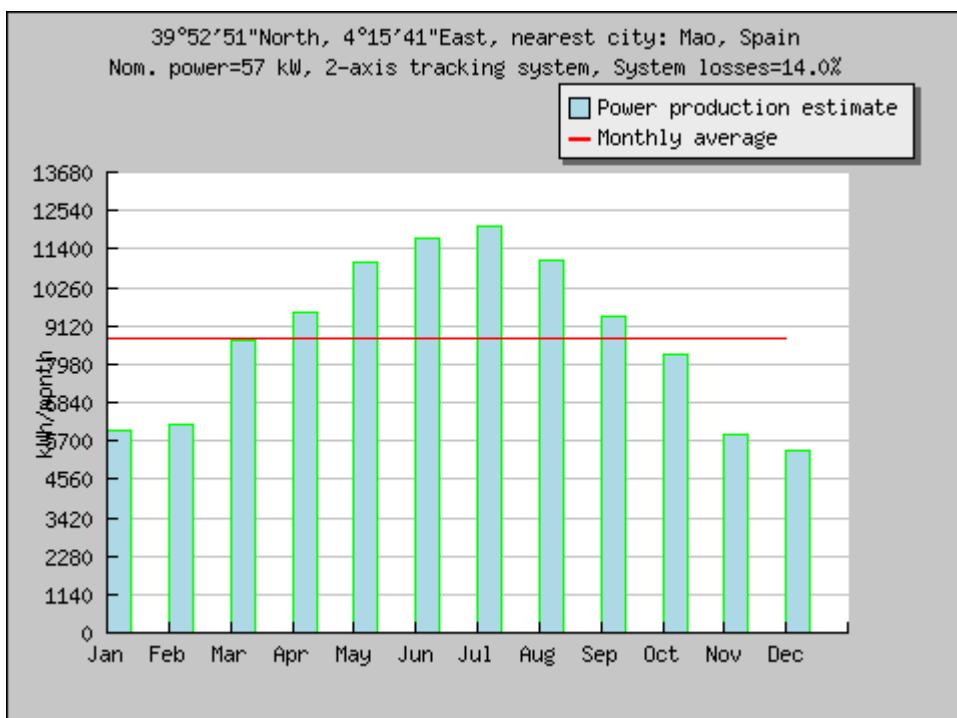

Other losses (cables, inverter etc.): 14.0%

Combined PV system losses: 25.5%

This graph and table show the (estimated) amount of electric power you can expect each month from a PV system with the properties you entered (using optimal inclination and orientation, if you requested so). It also shows the expected average daily and yearly production.

This graph shows the power from a 2-axis tracking system

PV electricity generation for:
Nominal power=57.0 kW,
System losses=14.0%

Month	Inclin.=35 deg., Orient.=0 deg.		2-axis tracking system	
	Production per month (kWh)	Production per day (kWh)	Production per month (kWh)	Production per day (kWh)
Jan	4720	152	5987	193
Feb	4932	176	6170	220

Mar	6837	221	8706	281
